Content

1. Notice for safety

1.1 Read the manual carefully before use the machine, follow the manual to do running-in, adjustment and maintenance.

1.2 Before using the machine:

1.2.1 Check if there is engine crankcase or gearbox leakage; check the lubricant oil level and oil quality of crankcase and gearbox, replenish or change clean oil in time.

1.2.2 Please refuel the engine by clean diesel. Please refuel when the engine is stopped in ventilated place. Be careful not to let the fuel contact high temperature surface, electric parts or rotation parts. Don’t overfill the tank to avoid spilling, please check if the fuel spilled or leaked, wipe and dry the spilled fuel before start the engine. Fasten the fuel tank cap after refueling, no fire or smoking at refueling place, fuel storage place or working site to prevent fire hazard.

1.2.3 Check if each fastener is fastened; if each moving parts is loosened, interfered or blocked; if the rotating direction is right.

1.2.4 Check all exposed rotating parts, moving parts if there is reliable protection, if the safety signs are complete.

1.2.5 Check the clutch, blades, and cables if they are deformed or excessively worn.

1.2.6 If there is abnormal phenomenon, please eliminate it and do test run. There should not be interference, abnormal sound, excessive vibration during the test run. Engine speed should be within the limit of 3600r/min, over speed is not allowed. When change the parts involved in safety, please follow the manual or under the guide of professional technician.

1.3 Only adults who is trained and know the usage rules of the tiller can operate it.

1.4 The operator is not allowed to work after drinking, in spite of illness or overtired.

1.5 The operator should fasten the cloth and cuff while working, who is with long hair should also wear protective hat.

1.6 It is prohibited to modify the parts of tiller which is involved in safety and operation. The operator should concentrate while working.

1.7 After safety check, you may start the tiller, the tiller cannot bear heavy load when it just cold started, especially new tiller or after major repair.

1.8 Prevent the tiller with blades to run on the concrete road, stone path or gravel road. While tilling, avoid to bump into stone or other hard objects in order not to damage the blades.

1.9 Pay attention to working performance and sound of each part during operating. If any part connection is abnormal, there is any abnormal sound, must stop the engine immediately. When the engine is running, remedy the fault is forbidden.

1.10 Prevent the tiller from toppling over when working.

1.11 Reverse gear when your back is less than 2 meters from the field edge.

1.12 Please take off the resistance rod before switch to reverse gear.

1.13 Please be careful of gearbox and engine leakage during work, if it happens, stop the engine and check the tiller immediately, remove the fault in time to avoid environmental pollution.

1.14 Clear the weed and dirt on blades after stop the engine, it's prohibited to clear the blades by stick or hand when the engine is still running.

1.15 After working, please clean the dirt, weed or oil on the tiller.

1.16 Transport the tiller with rubber wheels between different fields.

1.17 Please check the tightness of the bolts on the blade assembly, bearing holder and other moving parts at regular intervals.

1. Training

1.1 Please read the user manual in depth, learn about control system and correct usage of the machine, master how to stop the tiller and rapidly hold the clutch.

1.2 Never allow children use the machine, never allow anyone use the machine before read the manual.

1.3 Keep other people away from the working area, especially children and animals.

2. Preparation

2.1 Completely check the field before working, remove all other objects, e.g. stone.

2.2 Before start the engine, hold the clutch and shift into neutral gear.

2.3 Do not operate the machine unless wearing proper clothing. Wearing non-slip shoe could improve the foothold stability.

2.4 Take care with the fuel, it's flammable.

1.4.1 Use appropriate container to keep the fuel.
1.4.2 Do not refuel the engine while it is working or still warm.
1.4.3 Please refuel outdoor carefully.
1.4.4 Before start the engine, screw up the fuel tank cap, wipe the spilled diesel.
1.4.5 No fire.

2.5 When the tiller is running, do not make any adjustment.

2.6 Wear safety goggles when prepare, operate or repair the tiller.

3. Operation

3.1 Keep your hands and feet away from the rotating parts.

3.2 When transporting the tiller on road, sidewalk or street, be careful of control, pay attention to traffic and be aware to potential danger.

3.3 If bump against any object, stop the engine immediately, check the tiller if there is damage, and repair the tiller before start working again.

3.4 Always be careful underfoot, avoid slipping.

3.5 If the machine vibrate abnormally, stop the engine and check the reason, vibration often indicates malfunction.

3.6 Before leave the control position, before clear the winded stuff on the blades or before repairing, adjusting and examine, must stop the engine first.

3.7 When the machine isn't under control, take any possible precautionary measures: separate the clutch, lower down the accessory, shift into neutral, stop the engine, and take off the start key.

3.8 Before clear, repair or examine the machine, the engine should be stopped, and make sure all moving parts stopped.

3.9 Do not run the engine indoor, the exhaust is harmful.

3.10 Ensure all protection are in position, without proper protections such as bumper and fender do not work with the tiller.

3.11 Keep children and pets away.

3.12 Do not overload the machine by large depth and high speed.

3.13 Do not travel too fast on slippery road. Watch behind carefully when move backwards.

3.14 Don't allow bystander get close to the machine.

3.15 When the engine is working, the muffler will be extremely hot, approaching or touching will be scalded.

3.16 Only the accessories and implements from original factory can be used.

3.17 Do not use the tiller when it's dim or the field of view is poor.

3.18 Take care when working on hard ground, the blade could be stopped by some objects. When it happens, release the handle and do not try to control the tiller.

3.19 Do not work on steep hills.

3.20 Prevent overturn when the tiller is moving on slope.

4. Repair and storage

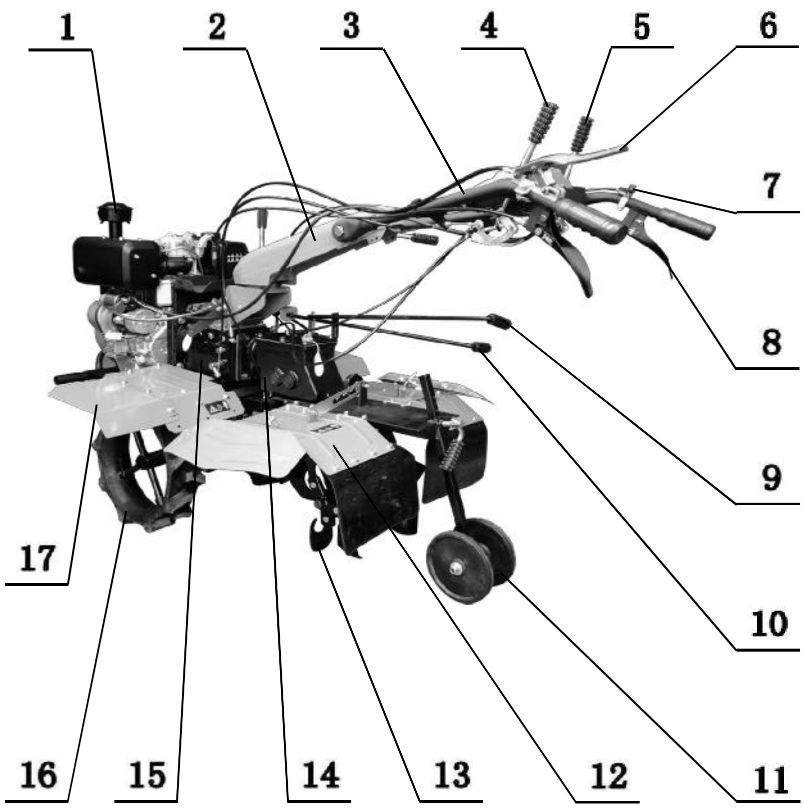
4.1 Keep the tiller, attachments and implements in good conditions.

4.2 Once in a while, check if the engine fixing bolts and other bolts are fastened to ensure the device is under safe working conditions.

4.3 Store the device indoor, away from source of fire. Cool down the engine first before store the tiller.

4.4 While store the tiller for long time, this manual should be kept together as crucial material.

4.5 Do not repair the device at will, unless you are experienced and with proper tools and disassembling, assembling guide.



1. Engine
2. Handle Base
3. Handle
4. Reverse Gear Bar
5. 1st Gear Bar
6. Clutch Bar
7. Throttle Switch
8. Steering Bar
9. Rotary Gearbox Shifting Lever
10. Front Shifting Lever
11. Guiding Wheel
12. Back Fender
13. Blades
14. Rotary Gearbox
15. Front Gearbox
16. Driving Wheel
17. Front Fender

1. Starting

WARNING: Shift lever should be at neutral position.

1. Follow the engine manual procedure to start the engine.
2. The engine should idle for 2~3 minutes (1500-2000r/min).
3. Check if the engine is running normally.

2. Operation

1. Clutch:

   Grip the clutch bar, the clutch is engaged; release the clutch bar, the clutch is disengaged.

2. Shifting Gear:

   2.1 Before shifting gear control**:**

   Disengage the clutch by release the clutch bar, shift the rod to the selected position, grip the clutch bar to start working.

   2.2 Front gearbox gears:

(1) Front gearbox shifting rod: 

(2) When use the reverse gear "-1" and slow gear "1", front gearbox shifting rod MUST be set to neutral "0" position;
(3) When use faster gears "2" and "3", reverse gear bar and slow gear bar MUST be set to neutral "0" position;
(4) When use "2" and "3" gears, back rotary gearbox should not work.

   2.3 Back rotary gearbox gears:

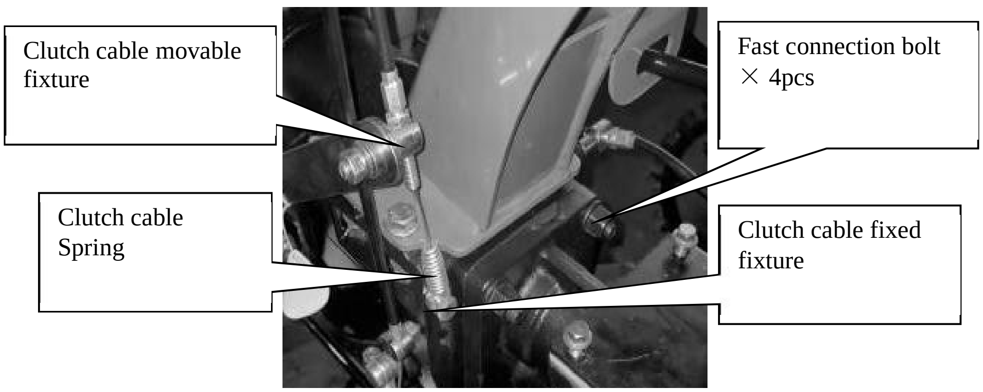
   Back rotary gearbox shifting rod: 

3. Note:

1. When the back rotary implement is working, the front gearbox should be set to “1” for propelling.
2. The back rotary implement gears:
   “1” gear: slower rotating speed, better torque output, working on hard soil and clayey soil, or deeper working depth.
   “2” gear: faster rotary speed, less torque output, working on paddy field and cultivated soil, increase the efficiency.
3. When back rotary implement is NOT assembled, use resistance rod, change front wheel into blades and choose “2” “3” gears to work with front blades.

1. Structure Introduction

1. The complete device is consisted from front tiller and back rotary implement, by using fast connection structure.
2. Back rotary implement is packed separately.



2. Clutch Cable (Normally Disengaged Clutch)

2.1 Screw the clutch cable locking nut near the clutch cable spring to the end of the bolt head;

2.2 Screw the the clutch cable bolt tube near the clutch cable spring into clutch cable movable fixture to the end of the bolt head and nut;

2.3 Put the clutch cable spring on the clutch cable fixed fixture , fasten the bolt and keep the spring fixed;

2.4 Adjust the locking nut, keep 1~2mm clearance between the tube and bolt head;

2.5 Grip and release the clutch bar repeatedly, inspect the spring, make sure it extends 3~5mm when gripping the clutch bar, and still fastens the locking nut when returns to normal.

3. Steering Clutch Cable:

3.1 Loosen the locking nut on the steering cable, screw the cable into steering clutch bar to the end;

3.2 Put the steering cable into the cable fixture on the bottom of gearbox, make sure the wire end is fixed in the bigger hole of the cable fixture.

3.3 Grip and release the steering clutch bar repeatedly while screw out the bolt on the cable gradually, if the differential clutch can completely engage and disengage, fasten the locking nut.

4. Reverse Gear Cable:

4.1 Loosen the locking nut on the reverse cable, screw the cable into the handle to the end;

4.2 Put the reverse gear cable wire into the reverse gear arm on the side of gearbox, make sure the wire end is fixed in the bigger hole of the rocker arm;

4.3 Move the reverse gear arm, put the cable wire into reverse gear cable fixture, make sure the cable tube is fixed in the bigger hole of the cable fixture;

4.4 Repeat moving the reverse gear lever while screw out the cable on the handle gradually, if the reverse gear can engage and disengage, fasten the locking nut.

5. Shifting Gear Cable:

5.1 Loosen the locking nut on the shifting gear cable, screw the cable into the handle to the end;

5.2 Screw the other side of cable into the shifting gear cable fixed fixture on the side of gearbox, and fix the wire end into the movable fixture on shifting gear arm;

5.3 Adjust the locking nut, keep 1~2mm clearance between the tube and bolt head;

5.4 Repeat moving the shifting gear lever while screw out the cable on the handle gradually, if shifting gear can engage and disengage, fasten the locking nut.

6. Accelerator Cable:

6.1 Turn the accelerator switch to max position (H).

6.2 Put the wire of accelerator cable through top hole of the diesel engine control panel and lower hole on the lever fork;

6.3 Pull the wire tight, screw the bolt on the lever fork and fix the wire;

6.4 Turn the accelerator switch repeatedly, until the lever fork on the control panel can reach both top and bottom position.

During working, because operation, friction wearing and load change, loose bolts, worn parts, engine power reduction and fuel consumption increase could happen on the tiller. In order to reduce the above incident, we have to do maintenance work regularly and strictly, to keep the tiller in good function, extend its working life.

1. Running-in

1. Engine running-in please follow the guide of the engine manual.
2. New tiller or after overhaul, should work without any load for 1 hour and work with light load for 5 hours, then drain the lube oil from engine crankcase immediately. Refill oil again and running-in for another 4 hours (refer to chapter 3), the tiller will be ready to work.

2. Technical maintenance

1. Maintenance before and after work

1.1 Listen and observe each part of the tiller, discover abnormal sound, overheat or loose bolt.
1.2 Check if there is leakage in the engine or gearbox.
1.3 Check the oil level of engine and gearbox, if it is between the maximum and minimum marks.
1.4 Clear the soil, weed and oil on the tiller and accessories in time.
1.5 Make working notes.

2. Grade 1 maintenance - every 150 working hours

2.1 Do all maintenance work above.
2.2 Clean the gearbox case and replace oil.
2.3 Check and adjust clutch, gear shifting and reverse gear system.

3. Grade 2 maintenance - every 800 working hours

3.1 Do all maintenance work for every 150 working hours of Grade 1.
3.2 Check all the gears and bearings, replace the worn ones.
3.3 Other parts of the tiller like the blades or joint bolts, replace damaged ones.

4. Technical maintenance - every 1500-2000 working hours

    1. Go to the after service center or the dealer's to disassemble the tiller, clear and check the tiller, replace worn parts or repair appropriately.
    2. Let the technician check the clutch core, especially friction plate.

5. Engine maintenance please follow the guide of the engine manual.

3.Maintenance Time Table

The interval regards to the working hours or the used months, depends on which is reached first.	Daily	8 hours under half load	1 month or 20 hours	3months or 150 hours	12 months or 1000 hours
Check and fasten the bolts and nuts	●				
Check oil level and fill it	●				
Clear and replace the oil		●1st time	●2nd time	●	
Check oil leakage	●				
Clear the soil, weed and oil	●				
Remove malfunction	●				
Adjust control parts	●				
Clutch Friction Plate					●
Gear and bearings					●

4.Tiller storage

To prevent rust, follow the steps below to store the tiller for long time.

1. Follow the engine manual to store the engine.
2. Clear the dust and dirt on the surface.
3. Drain the oil from gearbox and fill it with new oil.
4. Apply anti-rust paint to surface which is without painting and not aluminum.
5. Store the product indoor at ventilated, dry and safe place.
6. Keep the attachment tools, certificate of qualification and user’s manual properly.

1. **Engine malfunction and solutions, please refer to engine manual.**

2. Clutch malfunction and solutions.

Attention: Do not disassemble clutch assembly by your own.

Description	Reason	Solution
Clutch dysfunction	Clutch lever failure	Repair or replace
	Clutch cable failure	Replace
	Clutch fork not adjusted well	Adjust the cable or replace the fork
	Clutch fork, shaft not fixed well	Repair or replace
	Clutch fork break or bend	Replace
	Friction plate failure	Replace
	Spring failure	Replace
	Friction plates cannot touch the bearing surface	Add adjusting gasket under the bearing
	Bearing failure	Replace bearing and add lube oil in gearbox
Bad connection (holding the clutch lever, PTO rotates slowly)	Spring fatigue and failure	Replace
	Clutch fork shaft cannot rotate	Clear the shaft rotating surface
	Clutch cable not adjusted well	Adjust the clutch cable

FW
Honour Your Trust

3. Gearbox malfunction and solutions.

Description	Reason	Solution
Shifting problem	Bolt or nut behind the main shaft are loosen	Disassemble the bolt, nut and sheath behind the main shaft, put them back and screw tightly
Shifting fault	Connection piece worn	Replace
	Driving bevel gear loosen	Tighten the locking nut
	Shifting arm hole worn	Replace
	Spring inside main shaft fail	Replace
	Main shaft loosen	Tighten the bolt of gearbox cover
	Shifting lever deformation	Correct shifting lever or replace
Reverse gear fault	Reverse gear fork worn	Replace the fork or adjust cable
	Reverse gear cable fail	Adjust cable or replace
	Reverse gear shaft loosen	Tighten the bolts of the shaft
	Reverse gear fork jam	Clear the fork and connected parts
Reverse gear cannot rebound	Reverse gear shaft loosen	Tighten the bolts of the shaft
	Spring inside reverse shaft fail	Replace
	Reverse gear shaft deformation	Replace
Abnormal noise of gears	Bevel gear shaft, reverse gear shaft deformation	Replace
	Gear worn, too much clearance	Replace
	Bevel gear shaft, reverse gear shaft loosen	Replace
Main shaft and cover leakage	O-ring of main shaft fail	Replace
	Oil seal of main shaft fail	Replace
	O-ring of cover fail	Replace
Reverse shaft leakage	Reverse shaft bolt loosen	Tighten the bolt
	O-ring of reverse shaft fail	Replace

Description	Reason	Solution
Reverse fork leakage	O-ring fail	Replace
Clutch fork leakage	O-ring fail	Replace
Clutch shaft leakage	O-ring fail	Replace
Flange plate leakage	Bolt loosen	Tighten the bolt
	Gasket broke	Replace
Gearbox leakage	There is hidden void	Weld or paint to repair

4. Output system malfunction and solutions.

Description	Reason	Solution
Abnormal sound of gears	Gear worn or not assembled in order	Assemble again or replace gear
Gear running resisted	Assembled not in order	Assemble again
Overheat	Lacking of oil in gearbox	Fill the oil to the level mark
	Narrow gear clearance	Assemble again
	Narrow axial direction clearance	Assemble again
Leakage between gearboxes	Connecting bolts loosen	Tighten the bolts
	Gasket broke	Replace
PTO outer ring leakage	Oil seal fail	Replace
PTO inner hole leakage	Shaft sheath broke	Replace

5. Other malfunction and solutions.

Description	Reason	Solution
Blades broke	Hit rocks or other hard objects	Replace
Cable snap	Worn by time	Replace
